Sony Ericsson WidgetSuite
© 2010 mc_kibel

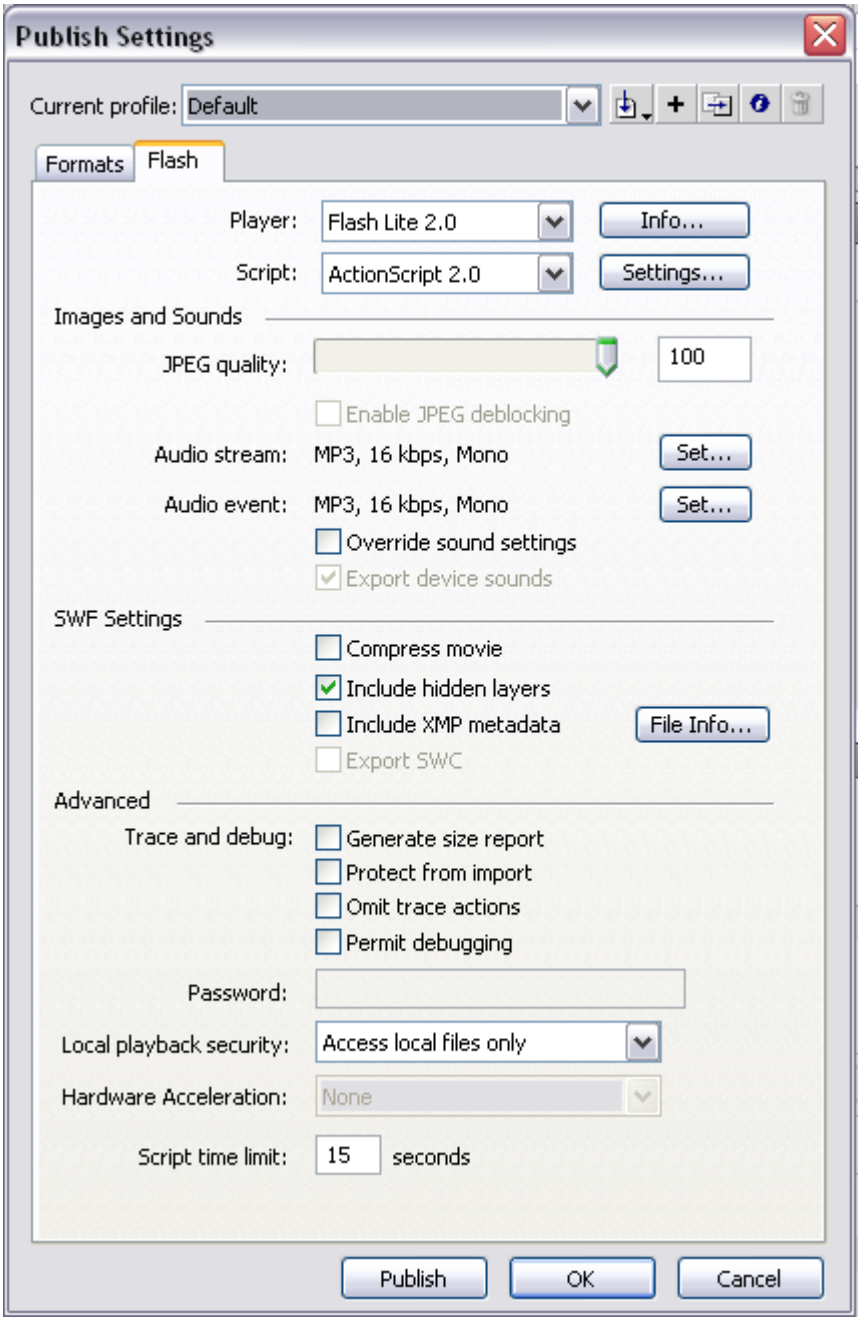

General information:
This project is extended and modified version of SE WidgetManager. It's dedicated for DB3350 phones, but it will work on any A2.
Important: To export your own created configuration, you will need Adobe Flash CS3 (or newer). You can get free 30-days trial on Adobe site.

1. How to use?
You need to create your own configuration first.
Download Sony Ericsson WidgetSuite Editor **1.1**:
http://www.sendspace.com/file/ipatwg

Watch the example video, showing how to create complete configuration.
https://www.youtube.com/watch?v=fqOgcj-4Wpc

More about SE WidgetSuite Editor:
-To enable/disable widget, click on it on the list.
-If widget is already enabled, click "E" to edit its properties.
-Click Prev. / Next screen to switch between screens.
-Click on "Simulate Media Player" to enable media player simulation.

Did you watch the video? Ok! Just copy content of textbox after pressing "Generate" and paste all to Config.txt in WidgetSuite directory on PC.
Now, open WidgetSuite.fla, click "Publish" at the bottom (CS3) or "Edit" near the "Publish" (CS4), then click "Publish" in just created window:

You can close Adobe Flash now. WidgetSuite.swf is ready to be copied to phone. Copy WidgetSuite.swf only and set it as wallpaper.

To switch between screens, shake your phone (to the left -> previous screen ; to the right -> next screen).

You can also download archive from attachment and use default config to see posibilities of this modification.

2. What's harder than in WidgetManager?
-Getting weather.

--Go to http://weather.joeearl.co.uk/
--Download weather for your city.
--Download WeatherFix.rar and extract it.
--Drag and drop weather.txt on WeatherFix.exe
--Remove weather.txt and rename just created weather.txt.fix.txt do weather.txt
--Place new weather.txt into WidgetManager.fla directory.

-**Setting note text**
--Open Note.txt. It's easy to edit, so I think I don't need to explain :)

-**Changing wallpaper is also harder:**
--Open WidgetSuite.fla, open "Main Content" in the library window and click twice on "Tween 1".
--Click on image and press "delete".
--Press CTRL+R and select new wallpaper **(480x320!)**
--Publish it.

-**After getting weather, editing note and changing wallpaper, you need to open WidgetSuite.fla and Publish it (as I wrote before).**

Yes, widgets can be added by flash, it must be created as separate movie clip and exported for ActionScript. You need to know a lil' bit more about flash to create your own widget (you can't add .swf widget, you must write it from scratch [or with help of any SWF decompiler :P]).
